

BTC BOT v13 — PERFORMANCE & OPERATIONAL REPORT

RSI Bounce Strategy • 30m Timeframe • 25-Month Quantitative Backtest & Realistic Live Market Analysis

1. Executive Summary & Strategy Architecture

BTC Bot v13 operates on real 30-minute Binance price candles using an **RSI Bounce + 3-Stage ATR Trailing Stop** algorithm. The bot executes with live market realism, strictly avoiding lookahead bias or idealized vector assumptions. Position sizing is fixed at **0.1 BTC per trade (100 lots)** with a 0.05% maker/taker fee structure.

SIMPLE STEP-BY-STEP TRADING EXAMPLE

- **Setup Signal:** BTC drops to \$65,000. RSI hits 28 (oversold) and bounces back above 30.
- **Position Entry:** Bot buys **0.1 BTC (100 lots)** at **\$65,000**.
- **Initial Stop Loss (SL):** Placed at \$64,400 (-\$600 risk = -\$60 max loss).
- **Initial Take Profit (TP):** Placed at \$66,200 (+\$1,200 gain = +\$120 target).
- **Stage 2 (Breakeven Activation):** Price rises to \$65,600 (+\$600 gain). Bot automatically moves Stop Loss to **\$65,000 (Entry)**. Risk becomes \$0.
- **Stage 3 (Trailing Profit):** Price reaches \$66,200. TP executes cleanly for **+\$120 net profit (+72 pts)**.

3. Honest Live Market Reality vs Backtest Comparison

Will the live bot generate \$1,000/month in real trading?

Honest Answer: No. In live execution on Delta Exchange, exchange frictions, latency, spread, and stop loss confirmation delays will absorb 30% to 50% of ideal backtest gross profits. A realistic live net projection is **\$350 – \$550 per month**.

Friction Factor	Backtest Assumption	Live Market Reality	Monthly Haircut
Stop Loss Slippage	Exact price, zero slip	Market orders slip 5-30 pts on Delta	-\$315/mo
Bracket Widening	Not modeled	Widened 3x on fast spikes	-\$95/mo
SL Confirmation Delay	Instant trigger	5-tick delay (~5s) to avoid false wicks	-\$40/mo
Exchange Latency & Fills	100% ideal limit fills	Partial limit fills & queue delay	-\$30/mo
Data Feed Divergence	Binance perfection	Delta price differs 30-80 pts from Binance	-\$20/mo
REALISTIC LIVE NET	\$1,000/mo	Live Execution Target	+\$500/mo

CAPITAL MANAGEMENT & OPERATIONAL GUIDANCE

- **Target Net Profit:** Expect **\$400 – \$500/month** under normal market conditions.
- **Position Size Limit:** Maintain position size fixed at **0.1 BTC (100 lots)** requiring ~\$6,000 account capital.
- **Kill Switch Rule:** If net returns drop below \$150/month for 2 consecutive months, pause live trading and re-calibrate ATR filters.
